

USER GUIDE

Every number
you see is
the number
that *happens*.

A complete trade manager for manual traders — plan on the chart, size the trade by risk, and let the panel protect the position while you watch the market instead of the mouse.

The whole tool at once: the dashboard on the left, one position opened in its own window, the stats window on the right, and every level drawn on the chart with its distance and its money.

INTRODUCTION

Thank you for giving this a place on your chart.

Helmsman was built for one kind of person: the trader who still makes the decision themselves. Not a signal service, not a black box — a steady pair of hands for the part of the job that is arithmetic and discipline, so the part that needs judgement gets your whole attention.

It is free. Not free-for-now, not free-until-you-need-the-good-features: **free, with no activation, no account limit, and nothing locked away.** Version 1 does everything you can see in this guide, and it will keep doing it.

That is also the honest part of the deal. Helmsman is the first piece of something larger — a small suite of tools built around manual trading, each one earning its place the same way. Building that takes time, and it takes

something from you that costs nothing but matters enormously: **a fair rating, and a review or comment that tells me what to fix or what to build next.** Every serious suggestion received so far is already in the product. Tell me what is missing, and it goes into the next version.

If something breaks, please say so plainly — a screenshot and the broker name is usually enough. A reproducible report becomes a fix with a proof behind it.

— *The developer*

THE ROAD AHEAD

What version 2 is being built toward

Written down here so you can hold me to it — and so your review can change the order.

NEXT

Challenge & funded-account mode

A live compliance card for prop-firm rules: how much you may still lose today, how far the target is, how many trading days you have, and a warning before a rule is broken rather than after.

NEXT

One-line pre-trade verdict

Risk, spread, session and the distance to the next high-impact event, combined into a single sentence under the buy and sell buttons before you commit.

SOON

Command bar

Type what you want — `buy 1% sl 300 tp 2R` — and have it staged instantly. For traders who are faster with a keyboard than with a mouse.

SOON

Portfolio view

Every open position across every symbol in one list, with a warning when several of them are really the same trade wearing different names.

PLANNED

Journal with pictures

Automatic screenshots at entry and exit, notes and tags on a trade, and an export you can study away from the terminal.

PLANNED

Your language

The panel and this guide in more than English. The wording is already centralised for it; the translations come next.

GETTING STARTED

Install and first attach

Where the file goes

1. In the terminal, open **File** → **Open Data Folder**.
2. MT5 Copy `Helmsman.ex5` into `MT5\Experts`. MT4 Copy `Helmsman.ex4` into `MT4\Experts`.
3. Back in the terminal, press `Ctrl + M` to refresh the Navigator, or simply restart it.
4. Drag **Helmsman** from the Navigator onto any chart.
5. In the dialog that opens, allow algorithmic trading and press OK. Make sure the terminal's own **Algo Trading** (MT5) or **AutoTrading** (MT4) button is switched on — with it off the platform refuses every order, and the panel will say so out loud rather than look broken.

GOOD TO KNOW

The values you set in that dialog are **first-attach defaults only**. From then on the panel itself is the living configuration: whatever you change on screen — position, size, theme, every field — is remembered and restored next time.

One panel per chart

Helmsman manages the symbol of the chart it sits on. Put it on a second chart for a second symbol; each keeps its own settings. If you run two panels at once, give them different **Expert ID** values so each one manages only its own trades.

MetaTrader 4 or MetaTrader 5?

The same product, built from the same source, on both platforms. Where a platform genuinely cannot do something, this guide marks it with a chip like **MT4** and says plainly what happens instead. You will not find a control here that quietly does nothing.

The same panel on MetaTrader 4 — same pages, same windows, same numbers.

ORIENTATION

The dashboard, part by part

The rail, on the left edge

Four icon tabs — **Trade**, **Manage**, **Parts**, **Settings**. The blue spine marks where you are.

The header

Stealth appears when hidden levels are available; **Stats** opens the big window on its charts; **News** opens that same window on the news tab; and – minimises the panel to its title bar.

The footer strip

The symbol switcher (< **XAUUSD** >) moves the chart to the next symbol in Market Watch. Beside it sits a clock that turns red when this market is closed, and the time left on the current candle. Small chips appear here when break-even, trailing or partial closes are armed, so you always know what is watching your trade.

Moving and resizing

Drag the title bar to move the panel. Drag the notches in the bottom-right corner to resize the whole thing — the size is remembered along with everything else.

PAGE ONE

Trade — from an idea to an order

Everything needed to place one correct trade, in the order a trader actually thinks: direction, then size, then where it fails and where it wins, then what it costs.

SELL and BUY

The two big buttons carry the live bid and ask, so you are never trading against a stale price. With confirmation on (the default) a small dialog shows the entire order before it goes anywhere.

Everything the order is, before it exists.

Lot, balance, the money at risk and what percentage of the account that is, the margin it will take, and the three prices. Tick **Don't ask again** to switch to one-click trading; you can switch it back on the Settings page at any time.

WHY THIS IS ON BY DEFAULT

One-click trading is faster and, on a bad day, faster in the wrong direction. The dialog costs you a quarter of a second and has prevented more mis-clicks than any feature in this panel.

Plan a trade on the chart

The wide button under the two big ones draws the planning box on the chart. It is explained in full in [the next section](#).

ORDER TYPE

Mkt sends at the market. **Stop** and **Limit** place a pending order at the distance in the box beside them, measured in points from the current price. When Stop or Limit is selected, the big buttons rename themselves — *BUY STOP +200p* — so what you are about to place is never a guess.

RISK > LOT SIZE

This is the heart of the panel. Set how much you are willing to lose, and the lot is calculated for you from the stop distance and the contract of the symbol.

- **The risk stepper** — click – or +, or click the number in the middle and type it.
- **The mode box** — what that number means: a percentage of **Balance**, a straight **Cash amount** in your account currency, a percentage of **Equity**, or a percentage of **Free margin**.
- **The Lot field** — you can also work the other way round. Type a lot size and the risk figure re-computes itself to match. Neither number is ever a leftover from the other.

STOP · TARGET · RATIO

The stop and target distances in points, and the reward-to-risk ratio between them. Type in any of the three and the others follow: change the stop and the target moves to hold the ratio; type a target and the ratio re-computes. Press the **RR** button to unlink them when you want the target somewhere structural instead.

The money card

Four lines that turn the plan into money, recalculated on every tick:

LINE	WHAT IT TELLS YOU
Risk	The money that is actually at stake and what share of the balance it is. Green up to your comfortable limit, amber up to the danger limit, red beyond it. If no valid lot exists, this line says so and the note underneath explains exactly why — usually that the risk is too small for the broker's minimum lot.
Costs	The spread right now in points and in money, plus commission per lot. Leave the commission input at zero and the panel estimates it from your own closed trades, marking the figure (<i>auto est.</i>) so you know where it came from — shortened to <i>est.</i> when the numbers are long enough that the full wording would not fit the row. If it has nothing to estimate from, the row says <i>comm not set</i> rather than showing you a commission of zero it cannot stand behind.
Margin	What this trade will take, and what stays free afterwards.
Reward	The money at the target, and the distance in points.
Swap	What one night of holding costs, for a buy and for a sell, at the lot shown above — because a trade you keep past the daily rollover pays this and the spread-and-commission line never said so. Brokers publish swap in nine different ways, and only two of them can honestly be turned into your account's money: a figure in points, and a figure already in your deposit currency. For the other seven — a rate in some other currency, a yearly percentage whose day count only your broker knows, or a position quietly reopened at market each night — this line says so in words rather than showing you a number it cannot stand behind. On the one weekday your broker charges triple, and only on that day, the line adds <i>3x Tonight</i>.

Quick actions — on the trades you already have

- **Breakeven** — move the stop of every open position to its own entry price.
- **Close %** — close that percentage of every position; the percentage sits in the box beside the button.
- **OCO** — a bracket: a buy stop above the market and a sell stop below it. When one fills, the other is cancelled automatically. If a fast market fills both, the later one is closed and the panel tells you it did.

Close positions & delete pending

The coloured buttons carry live totals, so you always know what you are about to close:

Buys, **ALL**, **Sells**, and then **Profit** (every position currently in profit) and **Loss**. Underneath, **All / Limits / Stops** delete pending orders by family.

Stealth mode

With **Stealth** lit, your stop, target and pending orders stop being broker-side orders and become panel-side levels. The broker sees a naked position; Helmsman watches the price and executes the level itself.

UNDERSTAND THIS ONE BEFORE USING IT

A hidden level only exists while the panel is running. Close the terminal, lose the connection, or remove the expert and the level goes with it — the position stays open and unprotected. The panel states this on screen whenever stealth is armed.

In this screenshot you can also see the close buttons carrying their live totals, and the money card explaining, in words, why no lot can be produced at that risk.

ON THE CHART

Planning a trade with your hands

Press **Plan a trade on the chart** and three lines appear — entry, stop and target — with a shaded box between them. The button changes to *Planning — drag the box, OK sends it* so you know the panel is waiting for you.

Grab any line anywhere along its length; there is no need to select it first. Drag the entry line and the whole box moves with it. Every number on the panel updates while you drag.

Each line carries its own distance, its money and, on the entry, the reward-to-risk ratio. The **OK** tag beside the entry names the order it will send — here a plain buy, because the entry sits at the market.

A whole plan in one picture: the box on the chart with its money on every line, the confirmation dialog showing the order before it exists, and the trade already running in its own window.

The OK tag knows what you drew

Drag the entry above the market and the tag becomes **OK · BUY STOP**; below it, **OK · BUY LIMIT**; at the market, **OK · BUY**. Click it and that order is sent, with the stop and target exactly where the lines are.

Right-click a line

- **Place the order now** — same as pressing OK.
- **Trailing stop: next rule** — step through the trailing rules; the stop tag immediately shows the chosen rule by name, so you can see that it took.
- **Trailing stop: off**.
- **Remove the box**.
- **Nothing — close this menu**.

Everywhere else on the chart, your platform's own right-click menu is untouched. Helmsman only takes it over its own lines and its own panel.

What the labels can show

Every line label is built from tokens you choose on the Settings page: the kind of level, the lot size, the distance in points, the money, that money as a percentage of balance, the reward-to-risk ratio, and the price. Turn off what you do not read; the chart restyles instantly.

Manage — what happens after you are in

The rules that watch the trade for you. Everything here applies to positions you open from now on and, with one button, to everything already open.

The headline and the list

The top line counts your open positions, their total lots and their live profit. Under it, each position gets a row with its direction, size, entry and money. **Click a row** and that single trade opens in its own window.

AUTO-PROTECT (break-even + trailing)

Arm at profit is how far into profit the trade must go before the stop is moved. **Lock offset** is how far beyond the entry the stop lands — a few points past break-even so the spread cannot take you out at exactly zero.

The box below picks the trailing rule by name, and the field beside it is that rule's one number. **Apply to open positions** stamps both onto every trade you already have.

Manage, one position in its own window with its profit graph, and the stats window — all live at once. The dashed red line on the chart is a stealth stop: the broker cannot see it, the panel is watching it.

The trailing rules, in plain words

RULE	WHAT IT DOES	THE NUMBER BESIDE IT
Off	No trailing.	—
Fixed distance	The stop follows price at a constant distance.	points
ATR distance	The distance breathes with volatility, measured by ATR on a timeframe you choose.	× ATR
Follow MA line	The stop tracks a moving average, kept a small indent away.	indent, points
Follow PSAR	The stop tracks the parabolic SAR dots.	step / max
Last fractal	The stop sits beyond the most recent fractal high or low.	indent, points
N-bar high/low	The stop sits beyond the extreme of the last N candles.	bars
Keep % profit	Whatever the best profit reached, keep this share of it locked.	percent
Step by timer	The stop tightens by a fixed step every so many seconds — for trades you want out of on a clock.	points / seconds

CLOSE EVERYTHING WHEN

Two account-level exits: close every position when the net result reaches a profit, or when it reaches a loss. Switch either on and it arms itself as soon as you edit the amount. The third toggle also deletes pending orders when it fires, so a triggered basket does not leave orders behind.

PENDING ORDERS · BASKET

- **Trail pendings at** — pending orders follow the price at the given distance until they fill, so a breakout order keeps its distance from a market that walked away.

- **Basket break-even line on chart** — draws one dashed line at the single price where *all* your open positions together break even. For anyone averaging into a position, this is the number that matters.

Grid...

Opens the grid window: levels, spacing (fixed points or from ATR), lot multiplier, base lot, and whether the grid builds *behind* price with limit orders or *ahead* of it with stop orders. One real order is placed per level. Drag the first grid line on the chart and every other level re-spaces itself around it.

PANIC — flat everything

One button that closes every position and deletes every pending order on this symbol. It **arms on the first click** and turns red; a second click within five seconds fires it. Wait longer and it disarms itself.

The line under the card always tells you what is armed and what the news module currently knows, so the Manage page is readable at a glance without opening anything.

Parts — taking money off in pieces

A ladder of partial closes. The left column is your **profit steps**, the right column your **loss steps**, ten of each. Every row has three controls: a switch to arm it, how much of the trade

to close, and how far away that happens.

The row at the top of the page reads exactly like a sentence: *row 1 = close 50% at +300pt profit.*

What the numbers mean — the unit picker

- **Levels in points** — a plain distance from entry.
- **Levels in %** — a percentage of this trade's own target distance (and of its own stop distance on the loss side). Set 50% and every trade banks its first piece halfway to *its* target, whatever the symbol.
- **Levels in R** — multiples of the risk you took, where 1R is your stop distance.

How much to close

% of initial measures against the size you opened with; **% of current** measures against whatever is left.

Apply to open stamps the ladder onto every position you already have. Levels also apply automatically to new trades.

TWO DETAILS THAT SAVE REAL MONEY

Every armed level is drawn on the chart at its real price with its own tag, and a level that has fired greys out and is labelled *done* instead of vanishing — so you can see both what happened and what is still waiting. And if closing a piece would leave less than the broker's minimum lot behind, the panel closes the whole remainder instead of leaving an unclosable crumb.

IF A LEVEL REFUSES

A broker can refuse a partial close — bad price, a busy trade context, a volume it will not accept. Helmsman tries three times, then disarms that level for that position and writes the broker's own reason on this page. It will not sit there retrying and beeping at you forever.

Settings — the panel itself

Show on chart labels

Seven switches decide what every line label on the chart contains: **Kind** (SL, TP, BUY STOP...), **Lots**, **Points**, **Money**, **% Balance**, **RR** and **Price**. Every line restyles the moment you flip one.

One-click

Off by default: every order shows its confirmation dialog first. Turn it on when you want orders to go straight out.

Hotkeys

Arms the keyboard chords listed in their own section.

Panel scale

A manual zoom for the whole dashboard. Leave it and the panel follows your screen's DPI; set 1.25 or 1.50 on a very large monitor.

Screenshot now · Save preset · Load preset

A one-click chart screenshot into the terminal's files folder, and your whole panel configuration saved to — or restored from — a preset file.

Theme

Dark, **Light**, **Midnight blue** and **Slate & amber**. Every surface, including the floating windows and the chart labels, restyles live.

The four themes

Dark

Light

Midnight blue

Slate & amber

The same page in the light theme.

About / account info

Opens the page below: who your broker is, the account number, whether it is hedging or netting, the leverage and the currency — then the facts of the symbol you are trading, including **how many points make one pip on this symbol**. That single line explains why a distance that felt tight at one broker feels ten times tighter at another.

Journal / stats

A short summary of your closed trades, with a line that checks the panel's own arithmetic against the broker's history and says *verified* when they agree to the cent.

Show The 60-Second Tour Again

The welcome card that names every control appears once, on your first attach, and a click anywhere on it puts it away for good. If you sent it away in your first ten seconds and wished you had not, this brings it back — as often as you like.

Rules And Protection

Six pages of guard rails: the Guardian, trading hours, alerts, the four-stage break-even, the news guard, and what to do about trades you did not open here. Each is explained in its own section later on.

Redraw The Panel

The whole dashboard is a single object drawn onto your chart. Loading a chart template, or any tool that clears chart objects, can take it away — and until now the only way back was to remove the panel and add it again. Helmsman notices within a quarter of a second and rebuilds itself, but if you have just watched it vanish you should not have to take that on trust. This button rebuilds it on the spot, and it is harmless to press when nothing is wrong.

Confirm Bulk Close And Delete

On by default. The buttons that close a group of trades or delete your waiting orders ask for a second click first, and they say exactly what they are about to do — *Click Again Within Five Seconds To Close 3 Positions*. Neither act can be undone, and a mouse can slip. Switch it off if you want the single click back.

Keyboard shortcuts are not affected. **Shift** + **C** and the rest act at once, because a two-key chord is already something you did on purpose.

FLOATING WINDOW

One position, on its own

Click any row in the Manage list and that trade opens here, titled with its ticket, direction and size.

Lock Stop and **Lock Target** are the two switches under the price boxes. With one on, that line still sits on the chart with its handle, but dragging it does nothing to your trade: the line glides back to where the broker has it and the panel says *Stop Is Locked*. Typing a price in the box above still works — the lock guards the gesture, not the decision. It lasts for the session.

- **The headline** — live profit in your account currency, green or red.
- **The graph** — this trade's own profit since the window opened. The dotted line is break-even, so you can see at a glance whether it has ever been in the money.
- **SL and TP** — type a price and press **Apply SL / TP**; it goes straight to the broker.
- **Close, Close 50%, Reverse** (close and open the same size the other way), **Breakeven now**.
- **The trailing box and “This one”** — a trailing rule for *this position only*. The rest of your book keeps its own rules.

The window closes itself when the position is gone, so it can never describe something that no longer exists.

FLOATING WINDOW

Your history: charts, calendar, trades and the whole account

One window, five tabs, opened from **Stats** or **News** in the header. Drag it by the title, resize it from the corner, close it with the red X — and it places itself where the recent candles are not.

Four of the five tabs describe *the chart you are on*. The fifth, **Portfolio**, describes your account. Each page says which it is, so the two can never be confused.

Charts

Your net result, win rate, expectancy per trade and best hour; then the equity curve of closed trades, profit by hour of the day, and profit by day of the week.

The two histograms are the same trades cut two ways, and they answer different questions. **By hour** finds the session that costs you money. **By weekday** finds the day —

and the count under each bar is how many trades it is built on, so a single bad Tuesday is not mistaken for a pattern.

The line underneath is your longest winning run, your longest losing run, and your average result in **R**. **R** is the trade's result divided by the money you had at risk when it opened, so +2R means you made twice what you were prepared to lose. It needs a stop to have existed at entry — if a trade never had one, there is nothing to divide by, and the panel says so rather than inventing a number.

Calendar

The month day by day, with today outlined; the whole year month by month; and how your trades were distributed in R.

A real calendar, Monday first, with the 1st under the weekday it actually fell on — so a run of red Fridays looks like a run of red Fridays. Green days and red days are shaded, and each traded day carries its own result. < and > walk through the months and **This Month** brings you back.

Under it, the year as twelve cells, so a bad month is visible without paging to it. Under that, your **R distribution**: how many trades landed in each band from worse than -3R to better than +3R. Trades that closed without a stop at entry have no R at all; they are counted and

named beside the chart rather than being quietly drawn as zero, which would make a scattered record look tighter than it was.

This tab, like Charts and Trades, is about the symbol in the title. The month header names it.

Portfolio — the whole account

Every symbol you have traded with a panel attached, the same money grouped by the currency of the instrument, and one equity curve across all of it.

Helmsman keeps one journal per symbol, and each panel is the only thing that ever writes its own. This tab *reads* all of them together. It writes nothing, so at worst it can show you a wrong number; it can never lose a trade.

WHAT IT SHOWS	MEANING
The top line	Which account it is reading, and exactly which journals it found — named, not counted.
By symbol	Trades, win rate, net, your best and worst single trade, and when you last traded it.
By quote currency	Grouped by what the instrument is priced in — USD for gold, JPY for a yen pair.
By base currency	Grouped by what you were actually buying and selling — XAU for gold, EUR for a euro pair.
Combined equity curve	Every journal, in time order, as one line.

The money is always in your account's currency, whichever way it is grouped. Your broker converts a trade's result when it closes, so a gold trade and a yen trade already arrive in the same currency and add up honestly. The grouping tells you where the money came from, not what units it is in — and the table says so on its own header line.

Two things this page will always tell you rather than hide. It can only see symbols a panel has been attached to at some point — a trade taken on your phone, on a symbol that never had one, has no journal and is not here. And because the journals live with the *terminal* rather than with an account, a second account logged into the same terminal writes into the same files. Helmsman stamps every trade with the account that made it; trades from another account are left out of every number on this page and their account numbers are printed for you. Trades recorded before your copy started stamping are counted as yours, and the page says how many.

Rescan re-reads every file from disk. The page also refreshes itself when a trade closes on the chart you are on.

News

Time, currency, impact, event, previous and forecast — with an arrow showing which way the forecast points against the previous reading. The top line always says where the data came from, and the switch shows either this chart's currencies or all of them.

Trades

Every closed trade as a review table — and a row expanded into full sentences underneath it.

COLUMN	MEANING
Closed	When the trade ended.
Trade	Direction and size.
Held	How long the position was open.
Open / Close	The two prices.
Pips	The move in pips for <i>this</i> broker — ten points make a pip on a 3- or 5-digit quote, one point on a 2- or 4-digit one.
Gross	The price result, before costs.
Comm	Commission charged on the trade.
Swap	Overnight financing paid or received.
Net	What actually reached your balance.

Click any row and it expands: the ticket, when it opened, how long it was held, the move in pips *and* points with this symbol's points-per-pip spelled out, the full cost breakdown, and the result in R.

ABOUT THE SPREAD COLUMN

There is not one, and that is deliberate. Brokers do not record a per-trade spread anywhere in the history — its cost is already inside **Gross**. Rather than print a number that looks precise and is not, the table says so at the bottom.

PROTECTION

Guardian — the rules that stop you

Every guard is off by default. Switch on only what you want, from **Settings › Rules And Protection › Guardian** — or from the inputs before you attach, if you prefer to set a chart up once and forget it. When one fires it says **which rule** and **until when** — and closing trades always stays allowed, even while entries are locked.

GUARD	WHAT IT WATCHES	WHAT HAPPENS
Daily loss	Balance against the day's starting point.	Locks new entries for the rest of the trading day, and optionally flattens what is open.
Max drawdown	Equity against its own highest point.	Same lock, measured from the peak instead of the day.
Trades per day	How many entries you have taken today.	Refuses further entries once the cap is reached.
Consecutive losses	Losing trades in a row.	A cooling-off brake for the minutes you set; the panel names the time it expires.
Friday flat	The clock on Friday.	Closes everything at the time you choose and locks the weekend.
Spread gate	The spread at the moment you press buy or sell.	Blocks the entry and shows both numbers — the spread now and the limit you set.
Equity target	Account equity rising to an amount.	Banks the day: flattens everything once and locks.
Equity floor	Account equity falling to an amount.	Flattens everything once and locks.
Trading window	Server time and the weekday.	Entries only inside your hours and on your chosen days; an optional daily flatten at a set time.

Guard state survives a restart, so a lock cannot be escaped by closing the terminal and opening it again.

PROTECTION

Rules And Protection — six pages of guard rails

Six things used to be reachable only through the properties dialog before the panel opened: the Guardian, your trading hours, alerts, the four-stage break-even, the news guard, and what happens to trades you did not open here. They now live behind one door on the Settings page, and every edit takes effect the moment you make it — there is no Apply button to forget.

Settings › Rules And Protection opens the list. Nothing on any of these pages is on until you switch it on, and none of them can stop you closing a trade. They only ever stand between you and *opening* one.

One door, six pages. Each says what it is for before you open it.

Guardian — account limits

The fourteen controls that decide when Helmsman stops letting you open trades: the daily loss limit and the hour your day re-anchors, the drawdown limit measured from your equity's own peak, a cap on trades per day, a timed brake after losing trades in a row, the Friday flatten, a spread gate, and an equity target and floor.

The Friday time is two separate boxes, hours and minutes, on purpose: typed as text, a mistyped “21:00” would have been ignored in silence.

Trading hours and weekdays

A window entries are allowed inside, and a row of seven switches for the days. Set the closing time *earlier* than the opening time for a window that runs through midnight. Below it, a daily flatten with its own time, and whether it removes waiting orders too.

Server time, always — the same clock the strip at the bottom of the panel shows.

Alerts

Which events speak — fills, closes, waiting orders — and through which channel: the terminal's sound, its popup, a push to your phone, or email. Push needs your MetaQuotes ID set in the terminal and email needs its mail settings; the panel does not pretend otherwise. The last switch saves a chart image on every fill and close, linked from the journal.

Sound files themselves stay in the inputs — see the note below.

Multi-level break-even

Four stages instead of one jump. Each stage has a profit that arms it and a place the stop goes, in points beyond entry. This is separate from the single break-even on the Manage page, and it applies to new trades.

Stage by stage, the stop tightens as the trade matures.

News guard

How long before a calendar event entries stop, how long after they stay stopped, and whether everything is closed ahead of it. The impact filter decides which events count at all.

Where the calendar itself comes from is explained in the News section above.

Outside trades

What Helmsman does about a position it did not open — one you placed by hand, from your phone, or that another robot opened. Ignore it, announce it, or protect it automatically. The stop, target and risk used for that protection are the Trade page's own current numbers; adoption borrows them rather than keeping a second set you would have to remember to update.

Manual Trades Only leaves other robots' positions alone.

Four settings deliberately stay in the properties dialog: the two sound filenames, the news file path and the news feed address. They are text, and the panel cannot yet remember text you type across a restart — a box that quietly forgets what you put in it is worse than no box. They will move here when it can.

News — and where it comes from

With the news guard on, Helmsman refuses new entries from a few minutes before a filtered event until a few minutes after it, and can optionally flatten once before impact. The refusal always names the event.

MetaTrader 5

MT5 Nothing to set up. The terminal has a built-in economic calendar and the panel reads it directly.

MetaTrader 4 — pick one of two

MT4 MetaTrader 4 has no calendar at all, so Helmsman brings its own. Both routes are honest about where the data came from, and the news tab always prints the source.

Option 1 — straight from the internet (simplest)

1. In the terminal, open **Tools** → **Options** → **Expert Advisors**.
2. Tick **Allow WebRequest for listed URL**.
3. Add this address to the list, exactly as written:

```
https://nfs.faireconomy.media
```

4. Press OK, then set the panel's input **Fetch the calendar over the internet** to true.

The feed is the weekly ForexFactory calendar in JSON — the same one MT4 news tools have used for years. If you ever want a different provider, the address is an input; anything serving the same fields works.

IF YOU SKIP THE WHITELIST

The panel does not show an empty list and leave you guessing. It prints the exact sentence: which URL to allow, and the menu it lives in. That is your switch to flip — no product can flip it for you.

Option 2 — from a file, with no internet permission

If you also run MetaTrader 5 on the same computer, attach the small companion expert **HelmNewsExport** to any MT5 chart. It writes the terminal's own calendar into the folder both platforms share, and every MT4 running Helmsman reads it from there. No web permission, and the data is MetaQuotes' own.

You can also point the input **Custom news CSV** at any file you maintain yourself. One event per line:

```
epoch,currency,importance(1-3),title,previous,forecast
```

SPEED

Hotkeys

Switch them on from the Settings page. Every one is a **Shift**-chord, so they never collide with the platform's own shortcuts. They work while the chart has focus.

KEYS	WHAT IT DOES
Shift + B	Buy at market — or send the plan, if the planning box is open.
Shift + S	Sell at market.
Shift + C	Close everything on this symbol.
Ctrl + Shift + B	Close the buys only.
Ctrl + Shift + S	Close the sells only.
Shift + P	Close every position currently in profit.
Shift + L	Close every position currently at a loss.
Shift + 1 ... 9	Close that many tenths of every position — Shift+5 closes half.
Shift + E	Move every stop to break-even.
Shift + D	Delete all pending orders.
Shift + O	Place the OCO bracket.
Shift + N	Open a fresh planning box on the chart.
Shift + H	Stealth mode on or off.
Shift + A	Drop an alert line where the mouse is; the panel speaks when price reaches it.
Ctrl + Shift + A	Clear the alert lines.
Shift + T / M / R	Jump to the Trade, Manage or Parts page.
Shift + K	Switch the theme.
Shift + X	Minimise or restore the panel.
Shift + ↑ / ↓	Step the chart timeframe up or down.

KEYS	WHAT IT DOES
Shift + + / -	Make the panel bigger or smaller.

REFERENCE

Every input, explained

These are the values in the dialog that opens when you attach Helmsman to a chart. They set the **starting state**; from then on the panel remembers whatever you change on screen. Names below are exactly what you see in the dialog.

Trade defaults

INPUT	DEFAULT	WHAT IT DOES
Expert ID	862001	The stamp Helmsman puts on its own orders. Give a second panel a different number so each manages only its own trades.
Max slippage (points)	10	How far the fill may drift from the price you asked for before the broker should refuse it.
Risk mode	% of Balance	What the risk number means: % of Balance, a Cash amount, % of Equity, or % of Free margin.
Risk	1.0	The risk number itself, read in the mode above.
Default SL distance (points)	600	Where the stop starts when the page opens.
Default TP distance (points)	1200	Where the target starts.
Link TP to SL by ratio	true	Keeps the target at a fixed multiple of the stop while you move things around.
Reward : risk ratio	2.0	The multiple used by that link.
Order-type row distance (points)	200	How far from price the Stop and Limit buttons place a pending order.
Default order comment	(empty)	Text attached to every order the panel sends.

Costs

INPUT	DEFAULT	WHAT IT DOES
Round-turn commission per lot	0.0	Your broker's commission for a full round turn of one lot. Leave it at 0 and the panel estimates it from your own closed trades and marks the figure <i>auto est.</i> (or <i>est.</i> on a long row), and says <i>comm not set</i> when it has nothing to estimate from
Risk % green up to here	1.0	Risk at or under this share of the balance shows green.
... amber up to here, red beyond	3.0	Above the first number and up to this one, the risk figure turns amber; past it, red.

Risk guards

INPUT	DEFAULT	WHAT IT DOES
Lot floor	0 = broker min	Never trade smaller than this.
Lot ceiling	0 = broker max	Never trade larger than this, whatever the risk maths says. The money card says when a lot has been capped.
Close everything at net profit	false	Arms the profit basket exit.
... when net P&L $\geq$	100	The amount that fires it.
Close everything at net loss	false	Arms the loss basket exit.
... when net P&L $\leq$ -	100	The amount that fires it.
Also delete pendings on fire	false	When a basket exit fires, remove pending orders too.

Stealth

INPUT	DEFAULT	WHAT IT DOES
SL/TP + pendings virtual	false	Levels live in the panel instead of at the broker. They only work while the panel runs — the page says so whenever it is on.
Pendings follow price	false	Pending orders keep their distance as price moves away.
Trail distance (points)	200	That distance.

Break-even

INPUT	DEFAULT	WHAT IT DOES
Break-even enabled	false	Move the stop to entry once the trade is far enough ahead.
Trigger mode	By points	Measure that distance in points, in R multiples, or as a percentage of the target distance.
Trigger	300	The number, read in the mode above.
Offset (points)	10	How far past entry the stop lands, so the spread cannot take you out at exactly zero.
Add spread to offset	false	Add the current spread on top of that offset.
4-stage progressive lock	false	Instead of one move, four: at each profit level the stop steps to its own lock. The four pairs follow in the dialog.

Trailing

INPUT	DEFAULT	WHAT IT DOES
Trailing rule	Off	Which of the nine rules to use — see the table on the Manage page.
Trailing parameter	300	That rule's single number: points, an ATR multiple, an indent, a bar count or a percentage, depending on the rule.
ATR / MA period	14	The indicator period for the rules that use one.
Trailing timeframe	M15	Which timeframe that indicator is read from — independent of the chart you are looking at.
Profit before trailing arms	200	Trailing stays asleep until the trade is this far ahead.

Guardian

INPUT	DEFAULT	WHAT IT DOES
Lock the day after a % loss	false	Arms the daily-loss rule.
... % below the day-anchor balance	3.0	How far down triggers it.
Server hour the day re-anchors	0	When a new trading day begins for that rule.
Lock after a drawdown from peak	false	Arms the drawdown rule.
... % below peak equity	10.0	How deep a drawdown triggers it.
Entry cap per day	0 = off	Maximum entries in one day.
Losses in a row before the brake	0 = off	How many consecutive losses start a cooling-off period.
Brake duration	60 min	How long that pause lasts.
Flatten + lock on Friday	false	Close everything before the weekend.
... at (server hh:mm)	21:00	The time it happens.
Daily-loss / max-DD also flatten	true	Whether those two rules close open trades as well as locking new ones.
Block entries when spread > points	0 = off	Refuse entries in a bad moment; the refusal shows both numbers.
Flatten + lock at equity $\geq$	0 = off	Bank the day at a target equity. Fires once.
Flatten + lock at equity $\leq$	0 = off	A hard floor under the account. Fires once.

News guard

INPUT	DEFAULT	WHAT IT DOES
Calendar window + pre-news lockout	true	Turns the news module on.
Minimum impact	3 = high only	Which events count: high only, high and moderate, or everything.
Lock entries N min before	15	How early the lock starts.
... until M min after	5	How long it holds afterwards.
Flatten N min before	0 = off	Optionally close everything once before impact.
Custom news CSV	(empty)	Read events from your own file instead — in the terminal's files folder, or the folder shared by all your terminals.
Fetch the calendar over the internet	false	Get events from the web address below. Needs the URL allowed in Tools → Options → Expert Advisors.
News URL	nfs.faireconomy.media	The feed to read. Any source serving the same fields works.

External and manual trades

INPUT	DEFAULT	WHAT IT DOES
External / manual trades	Announce them	What to do about trades Helmsman did not open — for example one placed from your phone. Ignore , Announce (touch nothing), or Protect .
Only manual / mobile trades	true	Adopt only trades with no expert stamp, so another robot's positions are left alone.
Missing SL/TP get panel defaults	true	In Protect mode, give an unprotected trade your default stop and target.
Close excess volume to fit panel risk	false	In Protect mode, trim a position that is larger than your risk settings allow — and say by how much.

Time manager

INPUT	DEFAULT	WHAT IT DOES
Trading window + weekday matrix	false	Only allow entries inside your hours and on your days.
Window start / Window end	08:00 / 22:00	Server time. Set the start later than the end for an overnight session.
Monday ... Sunday	Mon-Fri on	The days trading is allowed.
Daily close-everything at a time	false	Flatten the book once a day at a set time.
Flat time	22:30	When that happens.
Flat also deletes pendings	true	Remove pending orders in the same sweep.

Alerts and sounds

INPUT	DEFAULT	WHAT IT DOES
Trading sounds	true	Play a sound on the events below.
Screen alert popups	false	Also raise the platform's alert box.
Push to your phone	false	Needs your MetaQuotes ID set in the terminal's notification settings.
Email	false	Needs the terminal's mail settings configured.
Trade sound / Refusal sound	ok.wav / alert.wav	Which sound file to play for each.
Announce fills / closes / pendings	true	Which events are worth hearing about.
Screenshot every fill and close	false	Saves a picture of the chart at each event, linked to the journal.

Panel and planning lines

INPUT	DEFAULT	WHAT IT DOES
Panel X / Panel Y	20 / 20	Where the panel first appears.
Theme	Dark	Dark, Light, Midnight blue, or Slate & amber.
Panel scale	0 = auto	Fixed zoom for the dashboard; 0 follows your screen's DPI.
Saved live state wins on re-attach	true	Keep what you had on screen. Turn it off to make the inputs win every time.
Helm menus on its lines and panel	true	Right-clicking a planning line opens Helmsman's menu. Everywhere else the platform's own menu is untouched.
Show planning lines immediately	false	Draw the planning box the moment the panel loads.
One-click trading	false	Off means every order shows its confirmation first.
Zone style	Band	How the stop and target zones are drawn: a compact right-side band, a wide fill, or lines only.
SL/TP defaults from ATR	true	Start the planning box at a distance measured from recent volatility instead of a fixed number.
SL = ATR ×	1.5	The multiple used for that.
Releasing the entry line places the order	true	Drop-to-trade. Turn it off if you would rather always press OK.

INPUT	DEFAULT	WHAT IT DOES
Lines hide once the order is placed	true	Clears the planning box after it becomes a real order.
Label tokens	most on	Seven switches deciding what each chart label shows: kind, lots, points, money, % of balance, reward-to-risk, price.

STRAIGHT TALK

What Helmsman will not do

- **It will not tell you what to trade.** There are no signals here and none are planned. The decision stays yours.
- **It will not pretend a number it cannot know.** Where a figure is estimated it is labelled; where a broker records nothing, the panel says so instead of inventing a value.
- **It will not fail silently.** Every refusal — from the broker, from a guard, from the risk maths — is spoken in plain words, with the reason.
- **It will not hide behind a paywall later.** Free, without activation or an account ceiling.
- **Hidden levels are not magic.** Stealth levels live in the panel. If the terminal is closed, they are not watching anything, and the panel tells you that whenever stealth is on.

MT4 Four things the older platform simply cannot do, stated once: it has no economic calendar (use one of the two routes above), no stop-limit orders (asking for one is refused in words), no asynchronous closing (group closes are sequential and report what happened), and no netting accounts — every MetaTrader 4 account hedges.

Support, and reporting a bug

Version 1 is the beginning of this tool, not the end of it. If something is wrong, or missing, or simply awkward — say so, and it gets fixed.

The fastest way to get a fix

1. A screenshot of the panel or the chart at the moment it happened.
2. Your broker and account type — the **About** page on the Settings tab has every fact needed, in one screen.
3. What you expected, and what happened instead.

That is usually enough to reproduce a problem exactly, and a reproducible problem becomes a fix with a proof behind it.

Where to write

- **Email the developer directly** — shaikhsadi049@gmail.com. Bug reports and feature requests are read personally, and a clear one usually gets a reply with a plan.
- **The Comments tab** of the product page — best for questions others will have too.
- **A private message** to the author on MQL5.com — best for account details or anything you would rather not post publicly.
- **A review** — the single most useful thing you can do for this project. A fair rating and one honest sentence about what to build next is what keeps a free tool moving forward.

DEVELOPER

Shaikh Sadi
